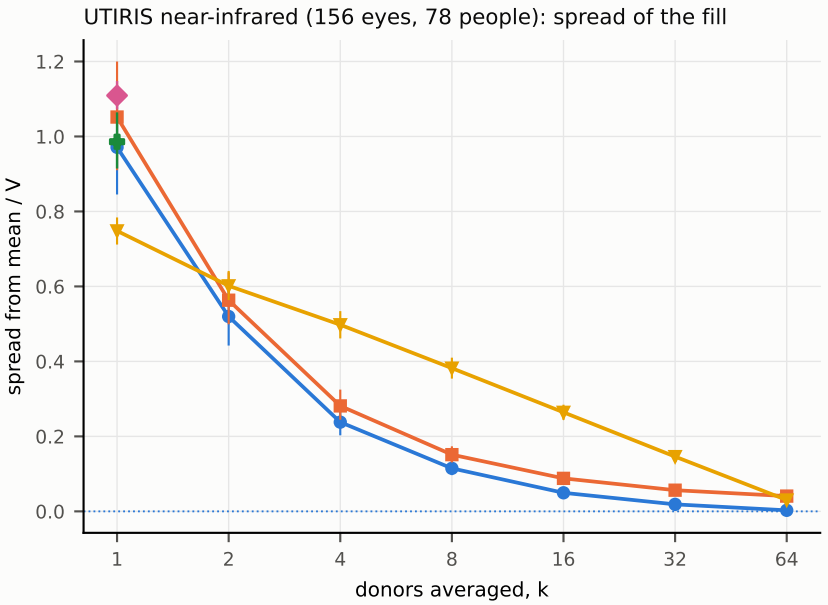
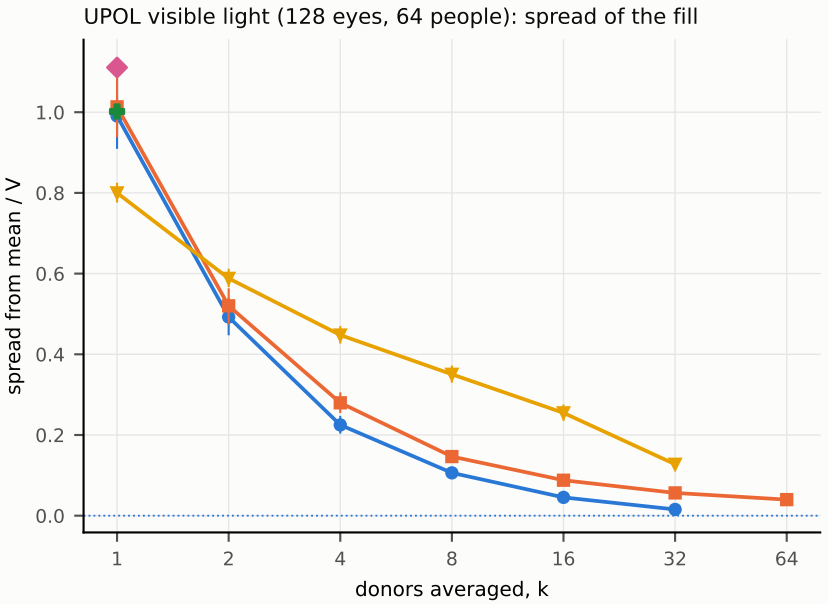
UTIRIS near-infrared (156 eyes, 78 people): error of the fill
theory: one stranger = 2
error / V
donors averaged, k

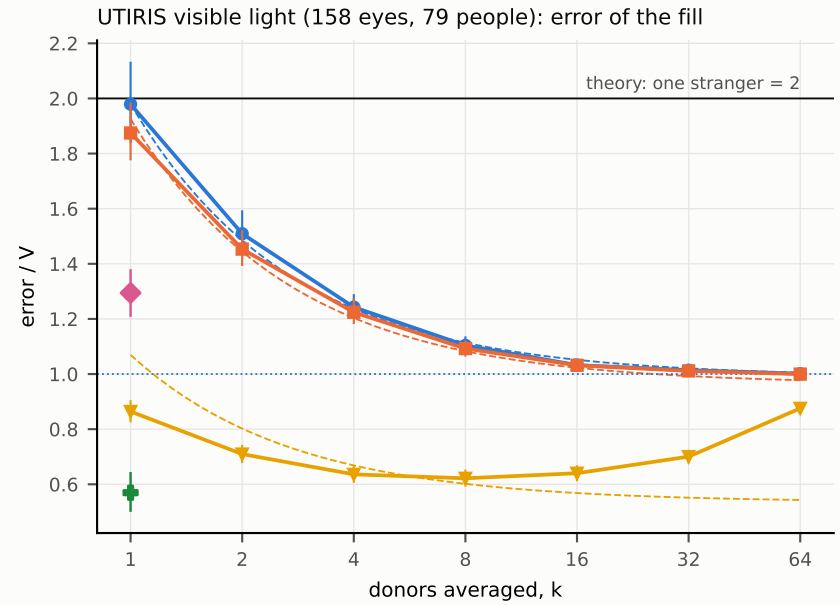


UTIRIS near-infrared (156 eyes, 78 people): spread of the fill
spread from mean / V
donors averaged, k

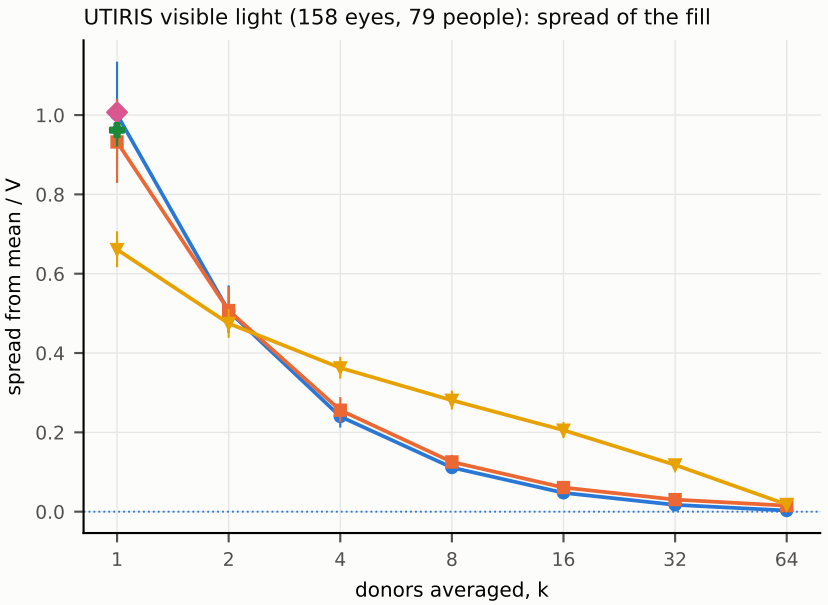
UPOL visible light (128 eyes, 64 people): error of the fill
theory: one stranger = 2
error / V
donors averaged, k



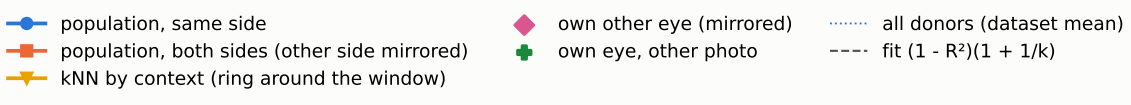
UPOL visible light (128 eyes, 64 people): spread of the fill
spread from mean / V
donors averaged, k



UTIRIS visible light (158 eyes, 79 people): error of the fill
theory: one stranger = 2
error / V
donors averaged, k



UTIRIS visible light (158 eyes, 79 people): spread of the fill
spread from mean / V
donors averaged, k



population, same side
population, both sides (other side mirrored)
kNN by context (ring around the window)
own other eye (mirrored)
own eye, other photo
all donors (dataset mean)
fit (1 - R²)(1 + 1/k)
